As I mentioned in my last post, I'm moving my workflows to open source, and I'm happy to announce that some of the tools I currently use are available as open source projects. Here's a short list of all the tools I use that are now available. The best part is that you don't have to download any source code, as these projects are hosted on GitHub. Once you got this draft for the comments and your thoughts together (e.g. “The recommended darkening on this pupil should hide the red near this, right?”) it will help you fine tune this process. Next time you’re editing a picture, make sure you have the comments (raw or in JPEG, as Adobe doesn’t yet provide a RAW comments file format in PSD files) in the same folder as the picture. You can also directly open a folder via the create comments window and choose the critical areas or the whole file. Now you’re ready for the comments, which you can edit in the same way as any other note in the script (e.g. “Maybe make the low light area a little darker?”). Once you are done, save the script, and it’s finally time for the folks from camera store & science abroad to do something with it. In the following example the PSD file from above was opened in Photoshop, the comments script was closed and reopened, and the final image was created using the comments in the script. We used the WB settings and added a little contrast to the low light areas and a little brightness to the mid tone areas. Plus some slight VSE (Vignette, Saturation & Exposure) tweaks. The script can be exported to a JSON file (its Parser file . php file) that contains the comments. Exporting is done using the ‘-o’ option: “export comments x.json”. Adding comments can be done with the ‘add comment’ option: “add comment x.json”. If you plan to do this, please follow the previous instructions carefully and you will have a script with

comments and a script with the final image created automatically. This saves a lot of time for you and your reviewers - and you get better photos.

Please note that Adobe and Lightroom are close partners, and both companies store data. Some privacy advocates say that Adobe in particular collects too much information and offers too many services to its customers. One of the big reasons for this is that Lightroom has been brought under the Creative Cloud umbrella and the privacy policies have been revised. That said, Adobe is attempting to offer less-intrusive services. The difference between the old CC and the new CC is roughly this: to use the old CC you need to be a paying subscriber, and most services require you to sync your data to their servers. In contrast, the new CC requires you to be registered on the platform. While Adobe wants to learn more about its customers and better understand how to provide a valuable experience, the company and its partners understand that there are limits to what can be offered in a secure and responsible manner. We can only hope that the Adobe customers who really want these services can convert by offering more feedback, knowing that their data is less safe in return. Other than that, the use of shape layers allows to create an accurate shape using curves shape. The movement of a shape layer is not as simple, since shape layers are working as parts or subbrushes. While offsetting a selection tool, the area under the coverage of the shape layer is lost. You need to use a boundary for every shape layer. And in addition to that, since the shape layer is based on the paths in the drawing area. You need to maintain its integrity by the nature of the shape layer.

There's also a feature designed to make your batches of images easier to use. After you've finished editing, you can select a folder of images, convert them to a specific format, and then apply all the settings to the selected images at once. Image files can also now be selected using different tools depending on the content: faces for portraits, skin for makeup, and so on. But make sure your images have an accurate color profile before you start editing - or you'll end up with inaccurate colors. With the Origin Pull feature, you can import photos from the web and pull images out of the full-color area. Photoshop can now capture motion based on the intensity of pixels in an image, enabling more sophisticated motion effects. What's more, you can now change the way an image's red, green, and blue channels are seen by the camera, enabling vivid saturation on more images straight from your video camera. For the more artistic photographers who might need something beyond these basic features, there's a feature called the Liquify Filter that lets you manipulate the layers of an image in different ways and then save the changes. You can tilt, rotate, and stretch layers, and can also simulate brushes that change color while you work. You can use the free part of Adobe Kuler to identify colors of your choosing and use them as a color palette within Photoshop. Adobe will eventually include the user's natural lighting profile to the architecture panel, although it's not yet set to be done so for Photoshop 2018.
